Stone Protection

Stone Enhancer (Wet Look)

Stone Enhancer is a non flammable solvent based penetrating sealer designed to enhance Porcelain, Sandstone, Limestone, Granite, Terracotta and other porous natural stone products.

Stone Enhancer penetrates the surface of porous substrates to give a wet look colour enhancement without altering the surface slip characteristics, providing excellent water and stain protection.

Properties:-

- Enhances colour of most natural stone.
- Protects against water damage
- Provides stain resistance properties against contaminants such as oil, grease, tea, coffee and wine.
- Does not alter the coefficient of friction or slip factor.
- Breathable, allows water vapour to escape.
- Deep penetrating.
- The solvent is a non flammable, de-aromatised paraffinic/naphthenic hydrocarbon

Directions:

- Protect any adjacent areas by masking to avoid splashes or overspray onto surfaces not intended to be treated
- The surface must be clean and **dry**
- Apply liberal coating of **Solvent Enhancer** using brush, roller or low pressure spray
- Leave the coating to penetrate for 5-30 minutes
- Wipe up excess with clean dry cloth using a buffing action
- Repeat the process for a greater depth of colour enhancement
- Do not allow excess to fully dry on surface as it may result in a residue that will need to be removed mechanically or chemically
- Can be walked on when the surface looks dry, takes 24 hours to cure
- Clean equipment with Turps
- Coverage 8-10sqm / L depending on porosity of substrate

Caution:

The colour change is irreversible so care must be used before application, testing a small inconspicuous area is essential to ensure the final result is to expectation.
